Jason's Hideout

1000

pwn **binary-exploitation**

You're playing tag with Jason when he suddenly runs away into a secret `hideout()`. Jump to this function and tag him – he will concede the final flag!

```
Conect to the remote server using netcat
with the following command: nc
ctf.htpatsa.com 5006
```

Attached is the following:

- `jasons_hideout.c`: `.c`-based source code
- `jasons_hideout`: compiled `.c` executable (it's a 32-bit ELF; figure out how to run it on 64-bit machines!)

Challenge 0 Solves x

Two Indexes

500

programming

You are given two parameters:

- `nums`, an array of four integers (ranges 0 - 25, unsorted)
- `target`, an integer

Output the **indexes** of the two numbers in the array `nums` which would add up to the integer `target`. The indexes should be outputted as a **sorted** array (i.e. `[0, 3]` is valid, `[3, 0]` is not). You may not use the same element twice.

Example 1:

```
[3, 13, 10, 8]
23
Input: [1, 2]
Explanation: nums[1] + nums[2] == 23
```

Example 2:

```
[7, 6, 9, 19]
13
Input: [0, 1]
Explanation: nums[0] + nums[1] == 13
```
